

Clio Mapping Custom Fields Workspace

- There are Custom Fields that are within Clio that hold data that is more often then not tied to a User (e.g., Assigned Partner)
- What they are looking for is some way to be able to perform a Bulk Update on the Data within that Field (not the changing the field itself, but the data within it)
- First Thoughts:
  - if we can find the Field Name, we should be able to just perform a simple Update
  - what I think they might have an issue with is that this one particular data element may be within multiple fields (remember users think of data through the front end -- data within the field -- not the field itself)

Clio Custom Fields in Templates Automation - Development Workspace

Developed Application:

Python/FastAPI Batch Upload/Download Processing of Updated Templates into Clio

Workflow Parts:

- Individual PowerShell Scripts execute different sections of Python Codebase:
  - Clio Template Batch Download Processing
  - Clio Template RegEx Dictionary Mapping for Custom Field
  - Clio Template Batch Upload Processing
- Additional Automation Part → Clio Batch Delete Function using the same PowerShell execution of Python Codebase

Clio Custom Fields Testing & Validation

Edge Case Testing Scenarios:

1. Mixed Case / Spacing in Custom Fields - Postive Testing
2. Mixed Case / Spacing in Custom Fields - Negative Testing
3. Fields Inside Tables / Headers / Footers
4. Templates with Abnormal Data Structures

Functional Testing Workflow:

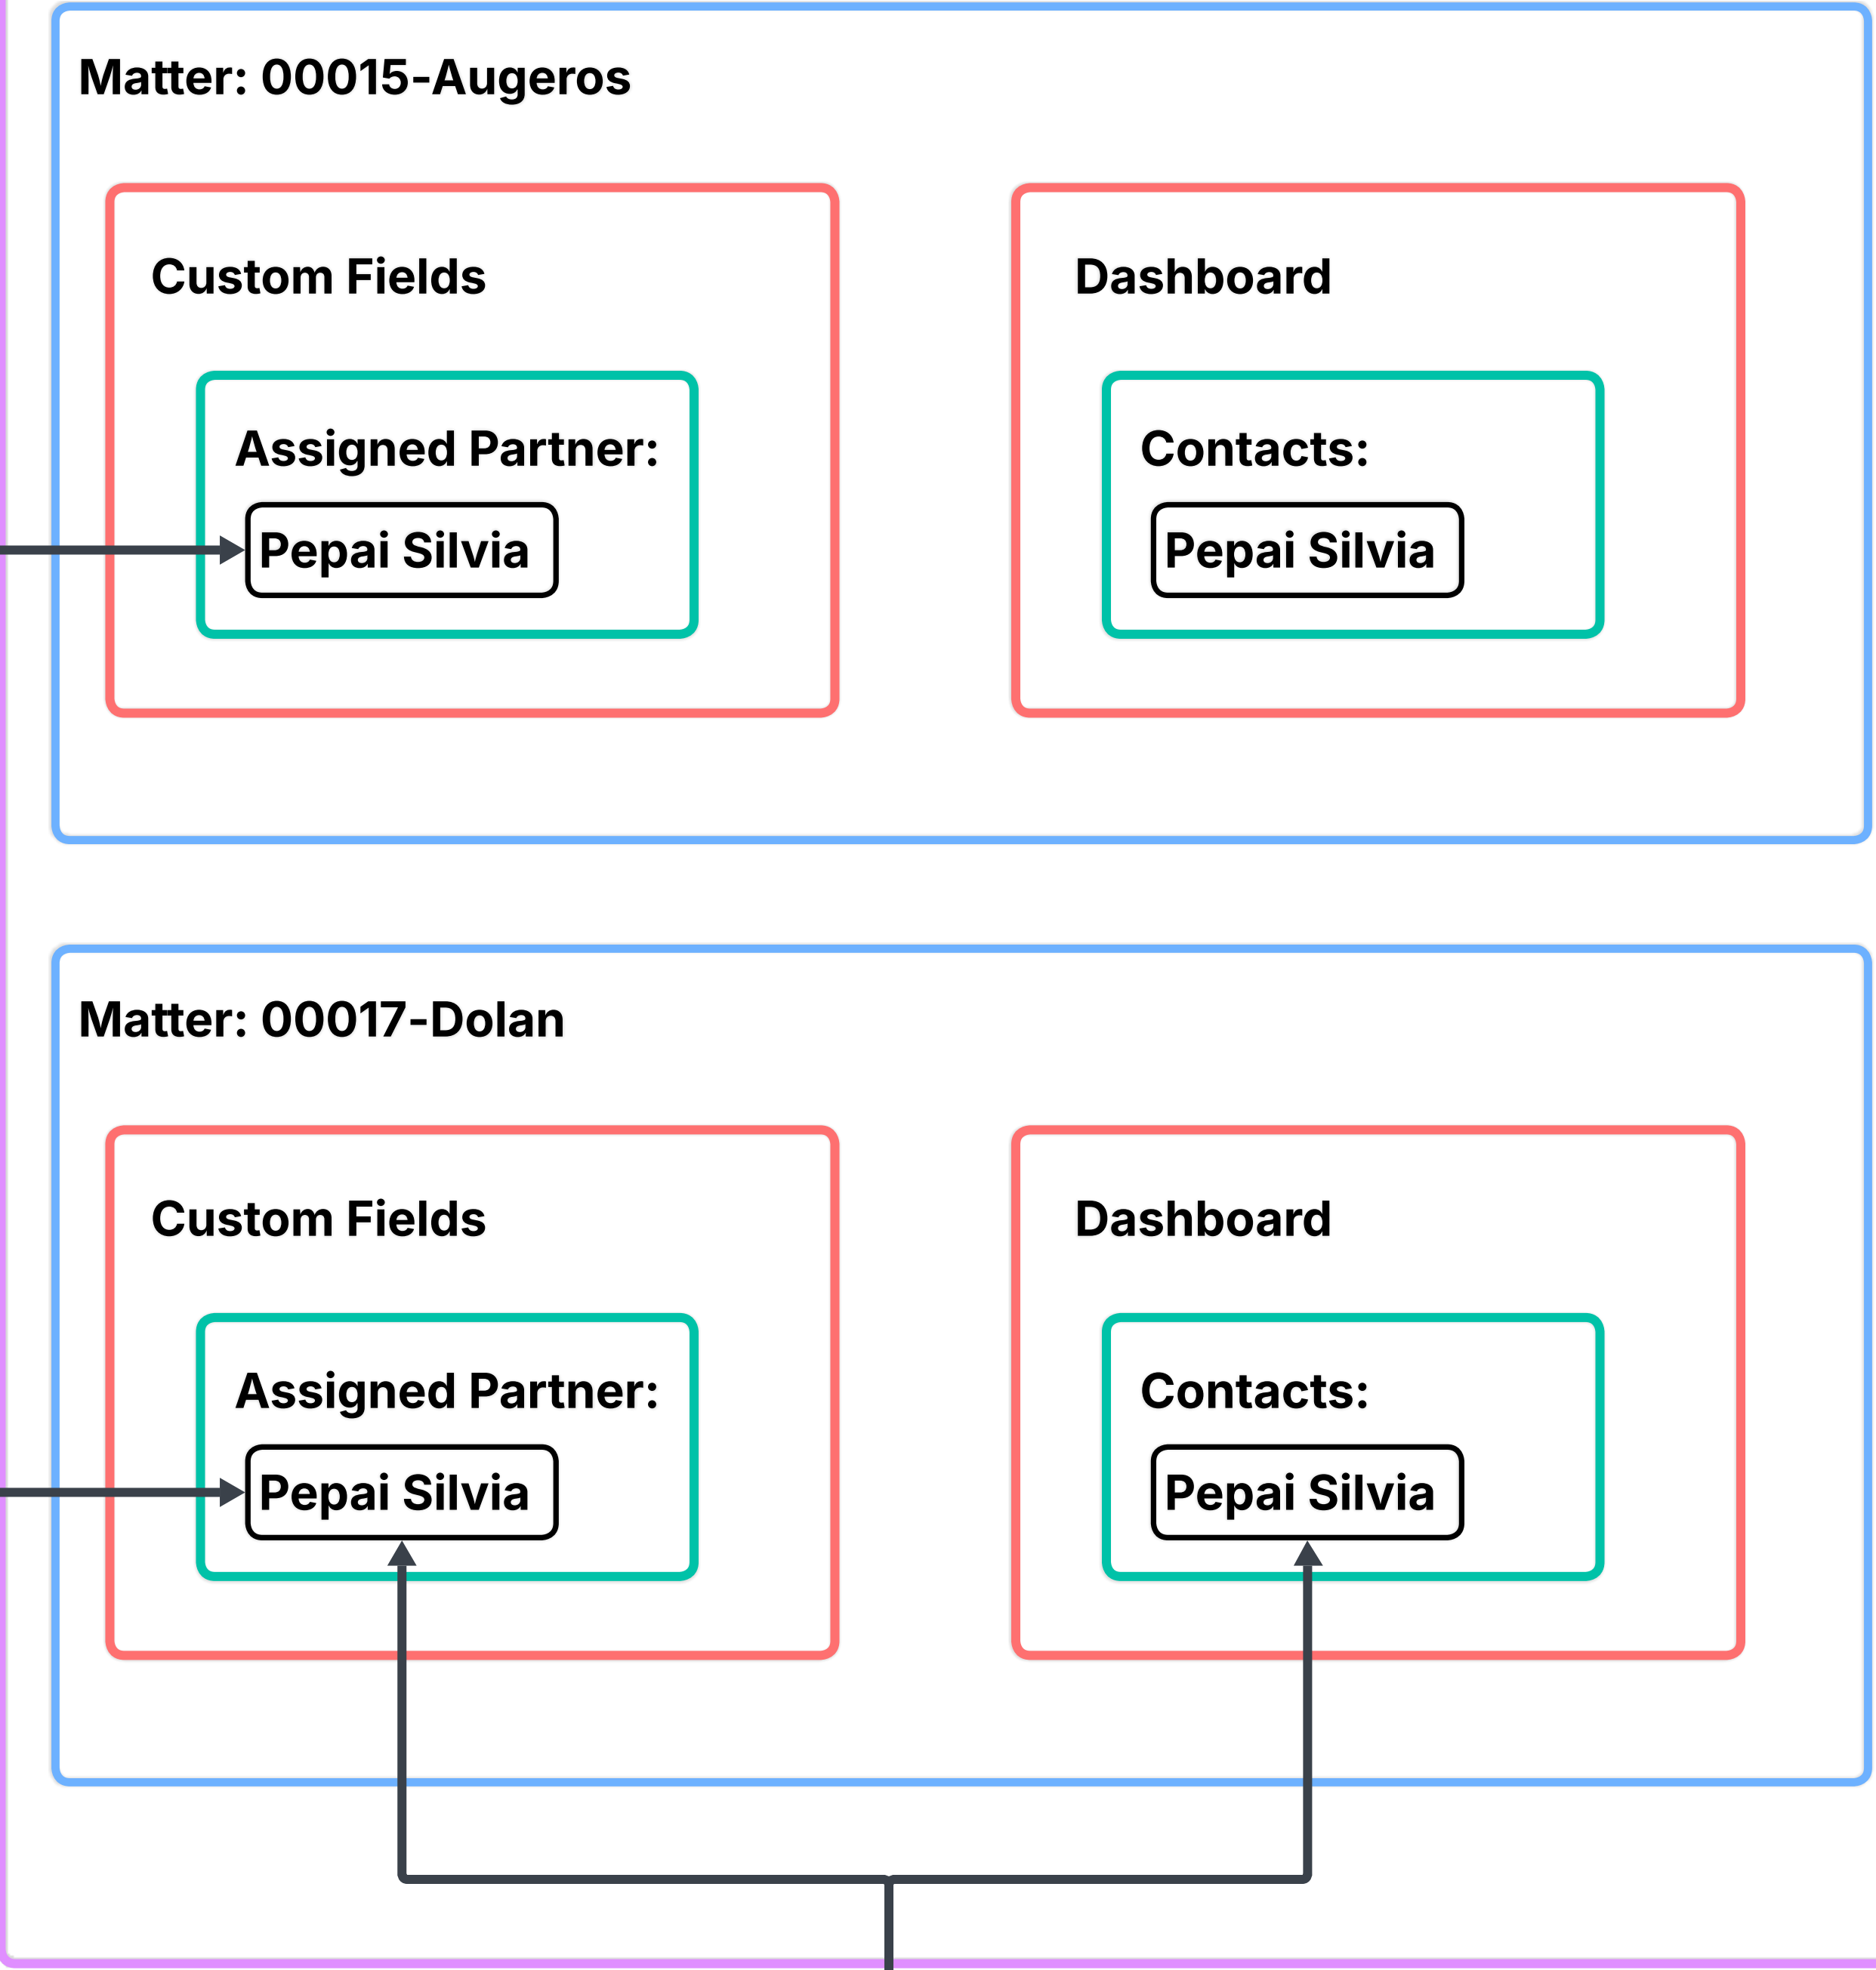

Clio Templates Sync - Download - Python Script

1. PowerShell script was run executing "clio\_templates\_sync.py" Python script, and with access tokens found in "clio\_tokens.json" we gain access to Clio Template Documents Folder through our API Connection
2. All Templates in Clio Template Documents folder were downloaded locally based on the file path entered within the PowerShell Scripts Argument of "--output-dir" (i.e., C:\User\.....ClioTemplates\_CustomFields\_MassUpdate\Template\_Download)
3. All Downloaded Templates were documented with their File Name and File/Template ID within "clio\_templates\_manifest.json", which is needed for the future data mapping procedures within the uploading of new templates into Clio
4. Templates within Download Folder are now ready to have the Mass Updated Templates Python Script be executed

Creating an API Call to create a Mass Update These Two Fields, Based Upon Field Name

100% Acheivable

CLIO APPLICATION

Developing an API Call Mass Update to update fields that just have an identical data element

CF Inventory Report

Inventory Custom Fields - Validation Report/Snapshot of CFs Pre Scan & Replace - Python Script

A Validation Report was executed using the PowerShell script of:

```
python "C:\Users\Tim\OneDrive - quillarowlaw.com\Documents\ClioTemplates_CustomFields_MassUpdate\inventory_custom_fields.py"
```

This report gives us a baseline of all the Custom Fields within the Templates

Mass Update Templates - Python Script

1. PowerShell script was run which then executes the "mass\_update\_templates.py" Python script, which is the main script to complete the Custom Field Scan & Replace functions
2. When Scan & Replce
3. Templates with Abnormal Data Structures

Clio Templates Sync - Upload - Python Script

1. Template Download Folder, which contained 6 Templates that had undergone the Custom Fields Scan/Replace
2. Documentation of Testing Scripts which have a breakdown of Counts and Location of Custom Fields within each Templates
3. Templates with Abnormal Data Structures
